

Telstar® *High Containment Biological Safety Cabinets*

*Containment Solutions
for Laboratory*

Pharmacy Isolators

Sterilator

The positive-pressure isolators provide laminar airflow in the working chamber, making them ideal for products which have no biological risk but require high sterile conditions. This equipment not only provides a high level of containment against external contamination, but avoids the risk of cross contamination as they provide laminar air flow to the working chamber.

Cytolator

The negative-pressure isolators provide laminar airflow within the working chamber and are used for products biologically hazardous that also requires minimized cross contamination. An additional third HEPA H 14 prefiltration stage right below the workbench adapts the isolator to the requirements in the manipulation of hazardous substances like the preparation of cytotoxic medicines as prescribed in some countries recommendations.

Class III BioSafety Cabinets

MSC III

The Class III Biological Safety Cabinets have been especially designed for the handling of microbiological agents, offering maximum protection to the product, the environment and the user.

Designed according to EN 12469, the MSC Class III offers an ergonomically designed totally sealed which keep the user completely separated from the product by a physical barrier when total containment and user protection is required.

General Features

Pharmacy Isolators

- Working chamber & hatches in stainless steel 304.
- Microprocessor air flow control equipped with one sensor.
- Front window placed under a small angle for ergonomics, easily removed for maintenance.
- Stainless steel dripping tray underneath the air grids to remove spoil liquids.
- Glove systems (2 or 4), ports Ø 250 mm, with cuff ring system and latex gloves.
- Inlet & Exhaust HEPA H 14 filter with a G3 pre-filter system.
- Minihelic pressure gauge, monitoring the pressure level in the working area.
- Lighting unit constructed outside the working area, lighting level > 1000 lux.
- Selection of 1 or 2 hatches.

Additional third HEPA H14 prefiltration stage in Cytolator.

Sterilator

The Sterilator main chamber pressure (vs. ambient) is positive to the room. The main chamber is slightly more positive than the pass-through to assure aseptic conditions within the main chamber.

Cytolator

The Cytolator main chamber pressure (vs. ambient) is negative to the room. Both the main chamber and pass-through are always negative to the room, and provide protection to the product, user and environment.

Class III BioSafety Cabinets

- Microprocessor air flow control & LCD display.
- Stainless steel work tray.
- Hinged window with gas dampers for easy opening.
- Inlet & Exhaust HEPA H 14 filter with a G3 pre-filter system.
- Lighting unit constructed outside the working area.

MSC III

The Biosafety Cabinet working area is at a negative pressure of minimum 200 Pa to the room. The main chamber pressure (vs. ambient) is negative to the room to provide protection to the product, user and environment.

Options and Accessories

- Mechanical interlocking system.
- Stainless steel 316L interior and exterior.
- Stainless steel sliding tray.
- VHP connections.
- Stainless steel hanging rail /8 hooks.
- Taps (vacuum, water, O₂, air...).
- UV light with or without timer.

Gloves can be tested for leaks by use of a digital manometer or magnehelic gauge.

Stainless steel sliding tray prevents users fatigue during transfer procedures.
